Australian Standard™

Transport information and control systems—Requirements for an ITS/TICS central Data Registry and ITS/TICS Data Dictionaries

STANDARDS AUSTRALIA

This Australian Standard was prepared by Committee IT-023, Transport Information and Control Systems. It was approved on behalf of the Council of Standards Australia on 14 May 2004.
This Standard was published on 30 June 2004.

The following are represented on Committee IT-023:

AUSTROADS
Australian Automobile Association
Bus Industry Confederation
Commonwealth Department of Transport and Regional Services
Federal Chamber of Automotive Industries
ITS Australia
Society of Automotive Engineers-Australasia

Keeping Standards up-to-date

Standards are living documents which reflect progress in science, technology and systems. To maintain their currency, all Standards are periodically reviewed, and new editions are published. Between editions, amendments may be issued. Standards may also be withdrawn. It is important that readers assure themselves they are using a current Standard, which should include any amendments which may have been published since the Standard was purchased.

Detailed information about Standards can be found by visiting the Standards Web Shop at www.standards.com.au and looking up the relevant Standard in the on-line catalogue.

Alternatively, the printed Catalogue provides information current at 1 January each year, and the monthly magazine, *The Global Standard*, has a full listing of revisions and amendments published each month.

Australian Standards™ and other products and services developed by Standards Australia are published and distributed under contract by SAI Global, which operates the Standards Web Shop.

We also welcome suggestions for improvement in our Standards, and especially encourage readers to notify us immediately of any apparent inaccuracies or ambiguities. Contact us via email at mail@standards.org.au, or write to the Chief Executive, Standards Australia International Ltd, GPO Box 5420, Sydney, NSW 2001.

This Standard was issued in draft form for comment as DR 04264.

PREFACE

This Standard was prepared by the Standards Australia Committee IT-023, Transport Information and Control Systems.

This Standard is identical with, and has been reproduced from ISO 14817:2002, *Transport information and control systems—Requirements for an ITS/TICS central Data Registry and ITS/TICS Data Dictionaries*.

The objective of this Standard is to specify the framework, formats, and procedures used to define information exchanges within the Intelligent Transport System/Transport Information and Control Systems (ITS/TICS) sector. It defines the content of the ITS/TICS central Data Registry and Data Dictionaries, the registration process to enter data concepts into the Data Registry.

The terms 'normative' and 'informative' are used to define the application of the annex to which they apply. A normative annex is an integral part of a standard, whereas an informative annex is only for information and guidance.

As this Standard is reproduced from an international standard, the following applies:

(a) Its number appears on the cover and title page while the international standard number appears only on the cover.

(b) In the source text 'this International Standard' should read 'this Australian Standard'.

(c) A full point substitutes for a comma when referring to a decimal marker.

References to International Standards should be replaced by references to Australian or Australian/New Zealand Standards, as follows:

INTRODUCTION

0.1 Background

This International Standard has been developed by ISO/TC 204/WG 1, *Architecture*, in order to provide a framework for the documentation and registration of data that passes through system interfaces within the Intelligent Transport System / Transport Information and Control Systems (ITS/TICS) domain.

The International Standard is designed to maximize interoperability and facilitate information reuse.

This International Standard defines the registration process for ITS/TICS. It further defines the Data Dictionary and the Data Registry content and Data Registry management procedures.

Vision statement

> This International Standard envisions common use and maximum interoperability of data within the ITS/TICS sector by the creation and maintenance of an ITS/TICS Data Registry, supported by interface and application specific ITS/TICS Data Dictionaries, created and maintained in a common and interoperable form, and to ensure the minimization of duplication by clear rules for data concept definition and Data Registry management.

Mission statement

> The mission is to develop a standard to define the principles and concepts; scope; field of application; rules and procedures; definition and concept of operation for a central ITS/TICS Data Registry and ITS/TICS functional Data Dictionaries; and to make provision for the migration of data from ITS/TICS functional Data Dictionaries to the central Registry so as to maximize interoperability and minimize proliferation of similar (but inconsistently defined) data entries.

This International Standard defines the framework, formats, and procedures used to define information and information exchanges within the ITS/TICS sector. The standard is designed to be used by the ITS/TICS community at large, but should be of special interest to application developers, equipment providers, and Data Registry managers.

This International Standard specifies a set of meta attributes for ITS/TICS Data Dictionaries, as well as associated conventions and schemes, that enables the description, standardization and management of all exchanged ITS/TICS data. Through consistent use of these common structures and associated conventions and schemes, interchange of data and information among the various ITS/TICS functional subsystems via their specific application systems can be maximized. This International Standard also supports reuse of data elements and other data concepts across various ITS/TICS functional subsystems and their specific application systems

The Data Registry process defined within this International Standard is consistent with implementation(s) of the ISO ITS/TICS System Architecture defined in the ISO 14813 Standardization deliverables, particularly ISO 14813 Parts 2 and 3. This does not preclude the application of the Data Registry using alternative International, Regional or National System Architecture methodologies or techniques, indeed, a common Data Registry will ease migration and interoperability between such approaches.

The ITS/TICS data concepts that populate the ITS/TICS Data Registry may originate from a Computer-Aided Software Engineering (CASE) tool implementation of the ISO 14813 TICS Reference Architecture, from International Standards for ITS, from National implementations for ITS, or from the submission by relevant users. Data Dictionary entries are not limited to those generated by object oriented methodologies.

0.2 Document overview

This clause provides an overview of this International Standard. Clause 1 identifies the scope of this International Standard. Clause 2 identifies requirements for conformance to this International Standard. Clause 3 identifies references required for proper implementation of this International Standard. Clause 4 defines terms used in this International Standard and Clause 5 lists the abbreviations.

The requirements for the ITS/TICS central Data Registry and ITS/TICS Data Dictionaries begin in Clause 6 with an overview of the concept of operations for the ITS/TICS Data Registry and ITS/TICS Data Dictionaries. A framework describing the registration of different types of data concepts in the ITS/TICS Data Registry and the registration status levels are presented.

Clause 7 identifies the fundamental ITS/TICS data concepts while Clause 8 identifies the basic and administrative meta attributes used to document them. Clause 9 describes the naming conventions and name abbreviation conventions used. Clause 10 states the requirements for the data concepts and the meta attributes contained in the ITS/TICS Data Registry and ITS/TICS Data Dictionaries.

Clause 11 provides a reference model for national, regional and international relationships and summarizes internationalization aspects associated with national and regional requirements for the ITS/TICS Data Registry and Data Dictionary environment.

The annexes to this International Standard describe the specific details for implementing the requirements introduced in Clauses 6 through 11. Annex A details ITS/TICS functional operating procedures for registration and harmonization of data concepts. Annex B prescribes the detailed definitions and descriptions of the ITS/TICS Data Registry and Data Dictionary meta attributes. Annex C prescribes the meta attribute requirements for data concepts contained in the ITS/TICS Data Registry and ITS/TICS Data Dictionaries. Annex D specifies the naming and name abbreviation conventions and the process for converting ITS/TICS descriptive names to ASN.1 names. Annex E contains the rules for data representation in an information model, along with examples. Annex F describes the ASN.1 information object specification for an ITS/TICS data concept with examples.

The bibliography includes a list of documents related to this International Standard.

AUSTRALIAN STANDARD

Transport information and control systems — Requirements for an ITS/TICS central Data Registry and ITS/TICS Data Dictionaries

1 Scope

This International Standard specifies the framework, formats, and procedures used to define information exchanges within the Intelligent Transport System/Transport Information and Control Systems (ITS/TICS) sector. It defines the content of the ITS/TICS central Data Registry and Data Dictionaries, the registration process to enter data concepts into the Data Registry. Throughout the text, the Data Registry should be taken to mean the ITS/TICS central Data Registry.

Specifically, this International Standard specifies:

— framework used to identify and define all information exchanges;

— framework used to extend standardized information exchanges to support local customizations and combinations;

— information modelling method for defining ITS/TICS data concepts, when used;

— meta attributes used to describe, standardize and manage each of the data concepts defined within this framework;

— requirements used to record these definitions; and

— formal procedures used to register these definitions within the Data Registry.

The Data Registry described herein supports, and is designed to include, data concepts using alternative International, Regional or National System Architecture methodologies or techniques. A common Data Registry will ease migration and interoperability between such approaches.

2 Conformance

2.1 Conformance considerations

This International Standard prescribes a conceptual model, but not a physical implementation. Therefore, the meta model need not be physically implemented exactly as specified. However, it should be possible to map unambiguously to and from the implementation and the meta model.

Regional and National Data Registries/Dictionaries have the option of adopting data concept definitions from the ITS/TICS Data Registry/Dictionaries, but are not required to do so. However, in the case of exchanging information internationally in application programs, claiming conformance with this or other international Standards in ITS/TICS sector, it ***is*** a requirement to use only data concepts that have already been registered in the ITS/TICS Data Registry.
