Australian STANDARD®

STANDARDS Australia

Information technology — Computer graphics, image processing and environmental data representation — Style representation for mixed and augmented reality

AS ISO/IEC 21145:2025

This Australian Standard® was prepared by IT-031, Modelling and Simulation. It was approved on behalf of Standards Australia's Standards Development and Accreditation Committee on 21 May 2025.

This Standard was published on 6 June 2025.

The following are represented on Committee IT-031:

ANZLIC — the Spatial Information Council
Australian Border Force
Department of Defence (Australian Government)
IoT Alliance Australia
Queensland Health
Simulation Australasia

This Standard was issued in draft form for comment as DR AS ISO/IEC 21145:2025.

How to read this Standard

This page explains the meaning of the language and structure of this Standard.

Refer to Standards Australia's Standardisation Guide 006 for more details about drafting rules.

Australian and Australian/New Zealand Standards are voluntary unless they are referenced in legislation or called up in contracts.

Requirements

To conform to a Standard, all requirements in the Standard need to be met.

A requirement is any statement in the Standard which uses the word "shall".

Recommendations, permissions and possibilities

The following words are commonly used in Standards, but statements using them do not have to be followed to conform to the Standard:

(a) "should" means that something is recommended.

(b) "may" means that something is permitted.

(c) "can" means that something is possible.

Structure of Standards

A Standard always has the following parts:

(i) The Preface states who developed the Standard, what the Standard is aiming to do, and how it relates to other documents.

(ii) The Scope states what the Standard is about, what it covers and what it does not cover.

(iii) The Normative references clause lists other documents that are referenced in the Standard as part of requirements.

(iv) The Terms and definitions clause defines important terms to help with understanding the Standard.

A Standard may also include other parts, such as the following:

(1) A normative appendix sets additional requirements that need to be conformed to.

(2) An informative appendix provides additional information or guidance. They usually do not contain requirements. If an informative appendix does contain requirements, the Standard will explain when those requirements apply

(3) A Bibliography lists documents referenced in the Standard but not as part of requirements.

Many Standards include notes. Notes provide recommendations and/or guidance only. They never contain requirements.

Preface

This Standard was prepared by the Standards Australia Committee IT-031, Modelling and Simulation.

The objective of this document is to specify the following:

(a) Constructs for representing and specifying various augmentation and presentation styles. While augmentations can be in modalities other than the visual (e.g. aural, haptic), this work addresses the visual augmentation style only.

(b) A model for how to associate the stylization constructs to the augmentation objects. Specifically, the MAR behaviour object in ISO/IEC 3721 is extended for this purpose.

(c) Other miscellaneous functionalities and abstractions that support the stylization of augmentation objects.

This document is identical to, and has been reproduced from, ISO/IEC 21145:2023, *Information technology — Computer graphics, image processing and environmental data representation — Style representation for mixed and augmented reality.*

As this document has been reproduced from an international document, a comma is to be read as a full point when referring to a decimal marker.

Australian or Australian/New Zealand Standards that are identical adoptions of international normative references may be used interchangeably. Refer to the online catalogue for information on specific Standards.

The terms “normative” and “informative” are used in Standards to define the application of the appendices or annexes to which they apply. A “normative” appendix or annex is an integral part of a Standard, whereas an “informative” appendix or annex is only for information and guidance.

Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives or www.iec.ch/members_experts/refdocs).

ISO and IEC draw attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO and IEC take no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO and IEC had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents and https://patents.iec.ch. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html. In the IEC, see www.iec.ch/understanding-standards.

This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 24, *Computer graphics, image processing and environmental data representation*.

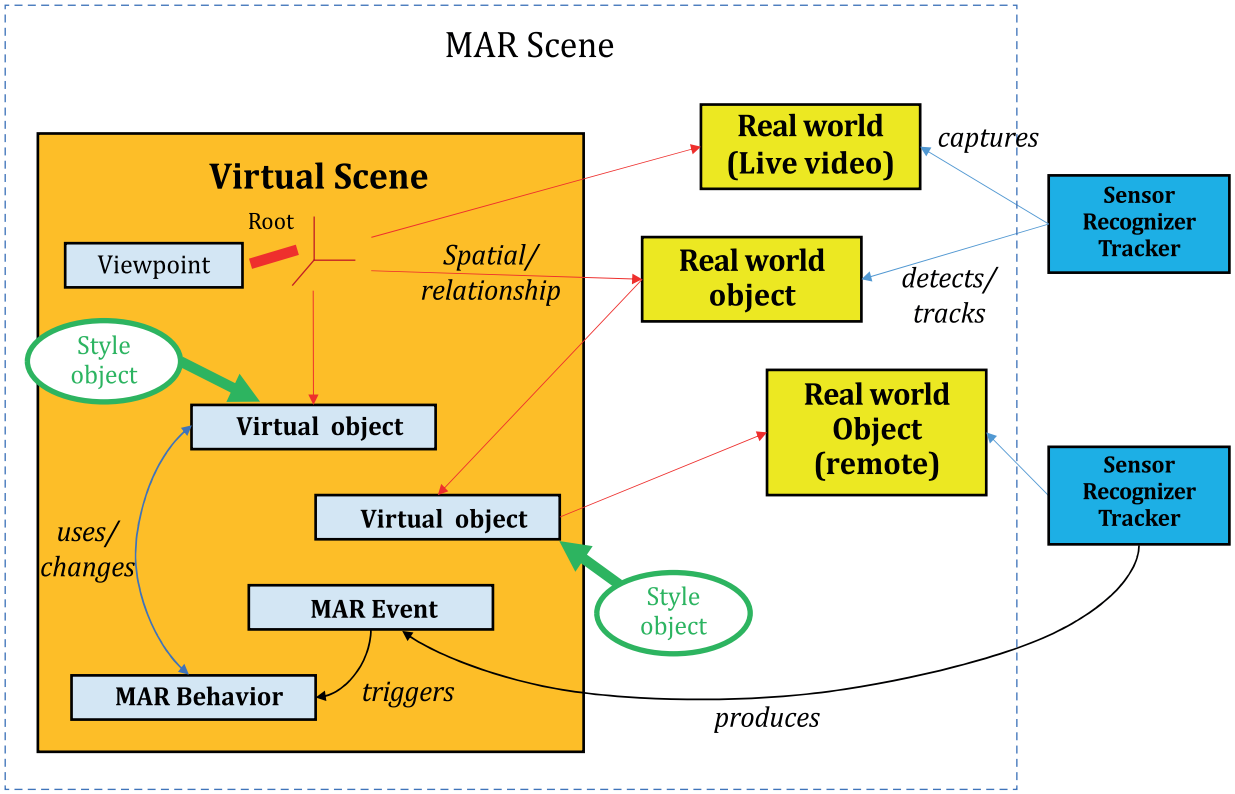

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html and www.iec.ch/national-committees.

Introduction

Mixed and augmented reality (MAR) refers to a spatially coordinated combination of media/information components that represent, on the one hand the real world and its objects and on the other hand those that are virtual, synthetic and computer generated. MAR as an information medium strives to provide rich experience based on realism, presence and augmentation [ISO/IEC 18039].

This document describes a set of information constructs for stylizing the MAR content and its objects. ISO/IEC 3721 specifies the MAR scene with the core objects and their attributes [ISO/IEC 3721] This document further refines ISO/IEC 3721 similarly to how CSS (Cascading Style Sheets)[2] augments HTML-5 (Hyper Text Markup Language)[1] for web document stylization. Among the various core MAR content objects defined in ISO/IEC 3721, virtual objects that augment real world objects may be subject to further stylization. Stylization refers to the act of making certain information follow a particular form for various purposes. As MAR contents become more widespread and sophisticated, there is an increasing need for its stylization and its separation from the core content for its efficient specification. The augmentation style can affect the whole MAR experience in terms of its naturalness (how harmonious objects appear in relation to the real world into which they are inserted), and conspicuousness and saliency (how augmentations stand out for visibility and readability). This in turn can be important for efficient information transfer through the MAR content. Style specification components are thus associated with and applied to the virtual objects used for augmenting the real world objects in the MAR content (see Figure 1).

The real world objects are associated or augmented with the virtual scene/objects shown within the left box. The style objects represent the constructs for further specifying their "styles" for presentation to the users.

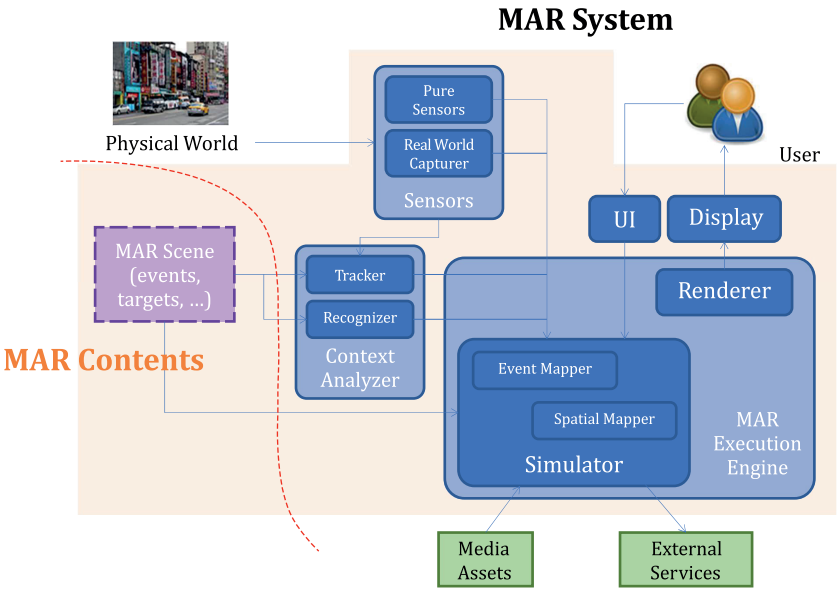

Figure 1 — The general structure of mixed and augmented reality (MAR) content [ISO/IEC 18039]

This work only establishes the information model, and neither promotes nor mandates the use of a specific language, file format, algorithm, device, or implementation method. It is to be considered as a minimum basic model and a sound basis that can be extended for other purposes in actual

© Standards Australia Limited 2025

implementations (e.g. application standards, specific file formats). It is designed for ease, generality, and extendibility and is illustrated in this document with various examples and implementation results.

This document is based on ISO/IEC 18039 which specifies a reference architecture for the MAR system as a contents-browser/player. In ISO/IEC 18039, the MAR content is specified as the input to the MAR system that describes the scene and objects' behavior. The MAR system parses, simulates and renders the content to the display (See Figure 2).

The MAR Scene or equivalent content description is an input to the larger MAR system which will interpret it and render it to a display for user consumption [ISO/IEC 18039].

NOTES

Australian Standard®

Information technology — Computer graphics, image processing and environmental data representation — Style representation for mixed and augmented reality

1 Scope

This document specifies:

1) Constructs for representing and specifying various augmentation and presentation styles. While augmentations can be in modalities other than the visual (e.g. aural, haptic), this work addresses the visual augmentation style only.

2) A model for how to associate the stylization constructs to the augmentation objects. Specifically, the MAR behavior object in ISO/IEC 3721 is extended for this purpose.

3) Other miscellaneous functionalities and abstractions that support the stylization of augmentation objects.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO/IEC 18039, *Information technology — Computer graphics, image processing and environmental data representation — Mixed and augmented reality (MAR) reference model*

ISO/IEC 3721, *Information technology — Computer graphics, image processing and environmental data representation —Information model for mixed and augmented reality content — Core Objects and their Attributes*

3 Terms, definitions and abbreviated terms

3.1 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO/IEC 18039, ISO/IEC 3721, and the following apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

— ISO Online browsing platform: available at https://www.iso.org/obp

— IEC Electropedia: available at https://www.electropedia.org/

3.1.1
stylization
act of enforcing certain information presentation to follow a particular form or behave in a given way for various purposes such as to highlight it, emphasize it, or make it more readable and perceptible

3.2 Abbreviated terms

AR	augmented reality
AV	augmented virtuality
