About the IEC
The International Electrotechnical Commission (IEC) is the leading global organization that prepares and publishes International Standards for all electrical, electronic and related technologies.

About IEC publications
The technical content of IEC publications is kept under constant review by the IEC. Please make sure that you have the latest edition, a corrigendum or an amendment might have been published.

IEC publications search - webstore.iec.ch/advsearchform
The advanced search enables to find IEC publications by a variety of criteria (reference number, text, technical committee, …). It also gives information on projects, replaced and withdrawn publications.

IEC Just Published - webstore.iec.ch/justpublished
Stay up to date on all new IEC publications. Just Published details all new publications released. Available online and once a month by email.

IEC Customer Service Centre - webstore.iec.ch/csc
If you wish to give us your feedback on this publication or need further assistance, please contact the Customer Service Centre: sales@iec.ch.

IEC Products & Services Portal - products.iec.ch
Discover our powerful search engine and read freely all the publications previews. With a subscription you will always have access to up to date content tailored to your needs.

Electropedia - www.electropedia.org
The world's leading online dictionary on electrotechnology, containing more than 22 300 terminological entries in English and French, with equivalent terms in 19 additional languages. Also known as the International Electrotechnical Vocabulary (IEV) online.

INTERNATIONAL ELECTROTECHNICAL COMMISSION

_____

MATERIAL DECLARATION FOR PRODUCTS OF AND FOR THE ELECTROTECHNICAL INDUSTRY –

Part 1: Guidance on the implementation of IEC 62474

FOREWORD

1) The International Electrotechnical Commission (IEC) is a worldwide organization for standardization comprising all national electrotechnical committees (IEC National Committees). The object of IEC is to promote international co-operation on all questions concerning standardization in the electrical and electronic fields. To this end and in addition to other activities, IEC publishes International Standards, Technical Specifications, Technical Reports, Publicly Available Specifications (PAS) and Guides (hereafter referred to as "IEC Publication(s)"). Their preparation is entrusted to technical committees; any IEC National Committee interested in the subject dealt with may participate in this preparatory work. International, governmental and non-governmental organizations liaising with the IEC also participate in this preparation. IEC collaborates closely with the International Organization for Standardization (ISO) in accordance with conditions determined by agreement between the two organizations.
2) The formal decisions or agreements of IEC on technical matters express, as nearly as possible, an international consensus of opinion on the relevant subjects since each technical committee has representation from all interested IEC National Committees.
3) IEC Publications have the form of recommendations for international use and are accepted by IEC National Committees in that sense. While all reasonable efforts are made to ensure that the technical content of IEC Publications is accurate, IEC cannot be held responsible for the way in which they are used or for any misinterpretation by any end user.
4) In order to promote international uniformity, IEC National Committees undertake to apply IEC Publications transparently to the maximum extent possible in their national and regional publications. Any divergence between any IEC Publication and the corresponding national or regional publication shall be clearly indicated in the latter.
5) IEC itself does not provide any attestation of conformity. Independent certification bodies provide conformity assessment services and, in some areas, access to IEC marks of conformity. IEC is not responsible for any services carried out by independent certification bodies.
6) All users should ensure that they have the latest edition of this publication.
7) No liability shall attach to IEC or its directors, employees, servants or agents including individual experts and members of its technical committees and IEC National Committees for any personal injury, property damage or other damage of any nature whatsoever, whether direct or indirect, or for costs (including legal fees) and expenses arising out of the publication, use of, or reliance upon, this IEC Publication or any other IEC Publications.
8) Attention is drawn to the Normative references cited in this publication. Use of the referenced publications is indispensable for the correct application of this publication.
9) Attention is drawn to the possibility that some of the elements of this IEC Publication may be the subject of patent rights. IEC shall not be held responsible for identifying any or all such patent rights.

IEC TS 62474-1 has been prepared by IEC technical committee 111: Environmental standardization for electrical and electronic products and systems. It is a Technical Specification.

This first edition of IEC TS 62474-1 cancels and replaces IEC TR 62474-1:2015.

This edition includes the following significant technical changes with respect to IEC TR 62474-1:2015:

a) IEC TR 62474-1:2015 was revised and converted to a Technical Specification in accordance with the requirements of the ISO/IEC Directives;
b) the introduction and scope have been updated to better align with the requirements of IEC 62474:2018;
c) by defining an authority, list identity and list version, the standard data exchange format can be used for lists other than the IEC 62474 database;
d) two types of material declarations, declaration for compliance and composition declaration, and their requirements are defined;

e) the material classes and exemption list capabilities have been improved;

f) guidance is provided on how to use data fields in the declaration of compliance and composition declaration to collect the information required for the European Chemical Agency (ECHA) Substances of Concern In articles, as such or in complex objects (Products) (SCIP) database;

g) six examples of material declaration are given to show how IEC 62474 meets various industry needs.

The text of this Technical Specification is based on the following documents:

Draft	Report on voting
111/654/DTS	111/671/RVDTS

Full information on the voting for its approval can be found in the report on voting indicated in the above table.

The language used for the development of this Technical Specification is English.

This document was drafted in accordance with ISO/IEC Directives, Part 2, and developed in accordance with ISO/IEC Directives, Part 1 and ISO/IEC Directives, IEC Supplement, available at www.iec.ch/members_experts/refdocs. The main document types developed by IEC are described in greater detail at www.iec.ch/publications.

A list of all parts in the IEC 62474 series, published under the general title *Material declaration for products of and for the electrotechnical industry*, can be found on the IEC website.

The committee has decided that the contents of this document will remain unchanged until the stability date indicated on the IEC website under webstore.iec.ch in the data related to the specific document. At this date, the document will be

- reconfirmed,
- withdrawn,
- replaced by a revised edition, or
- amended.

IMPORTANT – The "colour inside" logo on the cover page of this document indicates that it contains colours which are considered to be useful for the correct understanding of its contents. Users should therefore print this document using a colour printer.

INTRODUCTION

There are ever increasing legal regulations around the world along with supply chain requirements that either restrict or require reporting or labeling the use of certain substances in products. To determine a product compliance status, manufacturers need information about the substances in the product that can be passed down the supply chain. This can include data about materials as well as product parts used in products. This information can also be used as one of the inputs in an environmentally conscious design process throughout the product life cycles.

To make material declaration data readily available, the supply chain (including organizations providing products to the electrotechnical industry) needs a standardized method to exchange this type of data. The IEC 62474 standard is flexible for, not only identifying base requirements, but also allowing all levels of additional reporting under defined rules, so that the data is properly exchanged through the supply chain. The IEC 62474 standard uses a single format for data exchange rather than relying on each customer's own format.

Broad implementation by electrotechnical industry and organizations can result in:

- material declaration data being available as part of the contract sales of products in the electrotechnical industry,
- availability of material declaration data that is not dependent on an organization's size or purchase volume,
- improvement of data quality, reduction of compliance costs and reduction of inefficiencies, and
- faster assessments of products and materials compliance status.

Material declarations meeting the IEC 62474 standard provide data needed to make a substance compliance assessment. They can also be used as part of the technical documentation required to place products on the market in different regions. Examples are:

- the EU Restriction of Hazardous Substances (RoHS) Directive;
- the EU Registration, Evaluation, Authorisation and Restriction of Chemicals (REACH);
- the EU Eco-design Directive;
- the Administrative Measures for the Restriction of the Use of Hazardous Substances in Electrical and Electronic Products (China RoHS 2).

Government authorities that issue substance restriction regulations need to have economic methods to obtain substance data to conform to these requirements that allow for international trade. IEC standards such as IEC 62474 are recognized by the World Trade Organization (WTO). This means that government authorities can adopt IEC 62474 to provide an economically feasible standard to its resident companies to get needed data from a supply chain in order to achieve the substance restrictions and be assured that such rules facilitate international trade and are in conformance with WTO standards.

Also, restricted substance regulations usually include exemptions for certain products based on available technology or other issues. Exemptions are dynamic and often based on changes to technology and products. This requires government resources to evaluate exemptions from product suppliers and exemptions issued by other government authorities to determine suitability. It is possible governments are not able to update exemptions based on a direct referral to exemptions issued by other governments. This results in significant costs and time lags to do analyses and grant updated exemptions, especially if government authorities lack expertise or adequate funding to perform these tasks. If an exemption approved by a government authority is not adopted in a timely manner, this can put the local economy at a disadvantage because certain products cannot then be placed on the local market. In the case of some product sectors, such as medical devices, this also can prevent access to life-saving technologies.

IEC 62474 now allows government authorities to adopt exemptions from other government authorities by referencing the international IEC 62474 database. Since the IEC 62474 database maintains current exemption lists, governments may rely on this database without additional resources or time.

MATERIAL DECLARATION FOR PRODUCTS OF AND FOR THE ELECTROTECHNICAL INDUSTRY –

Part 1: Guidance on the implementation of IEC 62474

1 Scope

This part of IEC 62474 is a guidance document to help organizations properly implement IEC 62474. These organizations can be the ones creating tools for material data exchange and those who submit and receive material declarations.

This document supports consistent implementation of IEC 62474, including how the procedures, content, and form relating to material declarations for products can be further specified. It also illustrates how to apply IEC 62474 to non-electrotechnical industries.

This document:

- illustrates the flexibility and functionality of the IEC 62474 standard including examples,
- illustrates how to achieve conformity with IEC 62474, including guidance on preparing a declaration for compliance and a composition declaration, including mandatory and optional declaration requirements,
- illustrates how IEC 62474 can be applied to non-electrotechnical industries by preparing material declarations using an alternate declarable substance list (DSL),
- supports organizations that create software to exchange substance and material data to implement IEC 62474 in their tools, and
- supports users that submit and receive material declarations.

Following the IEC 62474 standard scope, process chemicals, emissions during product use and product packaging material are not in the scope of this document.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

IEC 62474:2018, *Material declaration for products of and for the electrotechnical industry*
IEC 62474:2018/AMD1:2020

NOTE The requirements of IEC 62474:2018 were not changed substantially by IEC 62474:2018/AMD1:2020. IEC 62474:2018/AMD1:2020 mainly explains certain requirements of IEC 62474:2018 more clearly and corrects some editorial errors.

3 Terms and definitions

For the purposes of this document, the terms and definitions given in IEC 62474 and the following apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

- IEC Electropedia: available at https://www.electropedia.org/
- ISO Online browsing platform: available at https://www.iso.org/obp

3.1
declarable article
article into which an instance of the substance of very high concern (SVHC) above 0,1 mass percent was first incorporated

Note 1 to entry: The EU REACH regulation imposes requirements on product suppliers to identify SVHCs that are present in their products above threshold. Following a European Court of Justice ruling, the European Chemical Agency (ECHA) published a guidance document clarifying that the threshold level for reporting the SVHC is 0,1 % of the first article in a product.

Note 2 to entry: The declarable article is sometimes referred to as the first article in the context of the EU REACH regulation.

4 Guidance on functionality of IEC 62474 material declaration

4.1 General information

As shown in Figure 1, the IEC 62474 standard defines two types of material declarations and their requirements:

1) The declaration for compliance provides the declaration at a product level in reference to the list of declarable substances (DSs) and declarable substance groups (DSGs) within the IEC 62474 DSL.
2) The composition declaration provides more detailed reporting of individual substances contained within the IEC 62474 DSL. Reporting can be at material, product part or product level as determined by regulatory requirements and contain very specific mass or mass percent type of information.

IEC 62474 also provides the capability to declare a material class (such as stainless steel, copper, gold, types of plastic), allow a higher level query to a set of questions (such as EU REACH or EU RoHS compliance (true/false)), support exemptions used by a given product, and include attachments for supporting documentation to a declaration or group of declarations.

At minimum either a declaration for compliance or a composition declaration shall be provided. Both can be provided along with a material class declaration, a query list, an exemption list and attachments. It is common for a query list to accompany a declaration for compliance or a composition declaration. If exemptions are needed, they are used in conjunction with the declaration for compliance and composition declaration. Both declarations can be communicated either in the requester/responder mode or the distribution mode.

IEC 62474 specifies the use of a dedicated database (the IEC 62474 database) that lists substances and substance groups requiring declaration. This provides certainty to suppliers regarding what minimum data is required to report, regardless of a manufacturer's product or customer location. The IEC 62474 database also includes a developer's table and XML schema that specify data exchange format (hereinafter referred to as "IEC 62474 DXF") requirements, material classes that may be used as an input to environmentally conscious design and exemption lists that are specific to a single law or regulation. The IEC 62474 database is maintained and regularly updated by global experts to meet changing legislation and broad customer requirements. The database can be found at: http://std.iec.ch/IEC 62474.

Another important feature of IEC 62474 is the flexibility to use other lists than the IEC 62474 DSL. The same declaration format can now use lists from other industries.
