Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 244, *Industrial furnaces and associated processing equipment*, in collaboration with the European Committee for Standardization (CEN) Technical Committee CEN/TC 186, *Industrial thermoprocessing - Safety*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

This second edition cancels and replaces the first edition (ISO 13577-4:2014), which has been technically revised.

The main changes are as follows:

— to provided better clarity methods B and C were combined to create a new method BC,

— Annex E was rewritten to provide several new examples to better reflect the intent for previously misunderstood elements,

— Annex B was modified to include clearer language and examples of normative wiring. The original Annex F was merged,

— created wording to provide a better alignment with IEC 62061, IEC 61511, and ISO 13849-1.

A list of all parts in the ISO 13577 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

This document was developed to specify the requirements of a protective system, which is a safety-related control system (SCS) of industrial furnaces and associated processing equipment (TPE). It is intended that in designing the protective system of TPE, manufacturers of TPE choose from the three methods provided in this document. Requirements for safety-related control functions of TPE are specified in ISO 13577-1, ISO 13577-2, and ISO 13577-3.

This document is intended to be used jointly with ISO 13577-1, ISO 13577-2 and ISO 13577-3. Since the other parts of the ISO 13577 series are type-C standards of ISO 12100, TPE are required to be designed in accordance with the principles of ISO 12100. The type-B standards of ISO 12100 for SCS are IEC 62061 or ISO 13849-1, which always assume high-demand applications. However, there are cases in which a risk assessment according to the IEC 61511 series, which provides the option of a low-demand rate on the protective system, is more suitable for the design of a TPE protective system.

In principle, when requirements of ISO 13577-1, ISO 13577-2 and ISO 13577-3 (type-C standards) are different from those which are stated in type-A or -B standards, the requirements of the type-C standards take precedence over the requirements of the other standards for machines, which have been designed and built according to the requirements of the type-C standards. Therefore, this document permits risk assessment for safety-related electrical control systems (SRECS) in which risk assessment based on the IEC 61511 series can be chosen as an alternative.

Industrial furnaces and associated processing equipment — Safety —

Part 4: Protective systems

1 Scope

This document specifies the requirements for protective systems used in industrial furnaces and associated processing equipment (TPE).

The functional requirements to which the protective systems apply are specified in ISO 13577-1 ISO 13577-2 and ISO 13577-3.

This document is not applicable to blast furnaces, converters (in steel plants), boilers, fired heaters (including reformer furnaces) in the petrochemical and chemical industries.

This document is not applicable to electrical cabling and power cabling upstream of the TPE control panel/protective system.

This document is not applicable to the protective systems manufactured before the date of its publication.

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 13574 and the following apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

— ISO Online browsing platform: available at https://www.iso.org/obp

— IEC Electropedia: available at https://www.electropedia.org/

3.1
final element
part of a *protective system* (3.6), that implements the physical action necessary to achieve or maintain a safe state

Note 1 to entry: Examples are valves, switch gears, and motors, including their auxiliary elements, for example, a solenoid valve and actuator if involved in the safety function.

[SOURCE: IEC 61511-1:2016, 3.2.22, modified — "BPCS or SIS" has been changed to read "protective system" in the definition.]

3.2
flame detector device
device by which the presence of a flame is detected and signalled

Note 1 to entry: It can consist of a flame *sensor* (3.9), an amplifier, and a relay for signal transmission.

[SOURCE: ISO 13574:2015, 2.65, modified — The second sentence in the original definition is presented as Note 1 to entry.]

3.3
logic function
function which performs the transformations between input information [provided by one or more input functions or *sensors* (3.9)] and output information [used by one or more output functions or *final elements* (3.1)]

Note 1 to entry: Logic functions are executed by the *logic solver* (3.4) of a *protective system* (3.6).

© ISO 2022 – All rights reserved

[SOURCE: IEC 61511-1:2016, 3.2.35, modified — "input functions" has been changed to read "input functions or sensors" and "output function" had been changed to read "output function or final elements" in the definition; Notes 1 and 2 to entry in the original definition had been deleted and Note 1 to entry has been added.]

3.4
logic solver
part of a *protective system* (3.6) that performs one or more *logic function(s)* (3.3)

Note 1 to entry: Examples are electrical systems, electronic systems, programmable electronic systems, pneumatic systems, and hydraulic systems. *Sensors* (3.9) and *final elements* (3.1) are not part of the logic solver.

[SOURCE: IEC 61511-1:2016, 3.2.36, modified — "either a BPCS or SIS" has been changed to read "a protective system" in the definition; Note 1 to entry in the original definition has been deleted.]

3.5
programmable (logic) controller
PLC
digitally operating electronic operating system, designed for use in an industrial environment, which uses a programmable memory for the internal storage of user-oriented instructions to implement specific functions such as logic, sequencing, timing, counting and arithmetic, to control, through digital and analogue inputs and outputs, various types of machines or processes

[SOURCE: IEC 61131-1:2003, 3.5, modified — The second sentence of the original definition and Note 1 to entry have been deleted.]

3.6
protective system
instrumented system used to implement one or more safety-related instrumented functions which is composed of any combination of *sensor(s)* (3.9), *logic solver(s)* (3.4), and *final elements* (3.1)

Note 1 to entry: This can include safety-related instrumented control functions or safety-related instrumented protection functions or both.

Note 2 to entry: For example, see Figure 2.

[SOURCE: ISO 13574:2015, 2.138, modified — Note 1 to entry has been merged with the definition.]

3.7
safety bus
bus system and/or protocol for digital network communication between *safety devices* (3.8), which is designed to achieve and/or maintain a safe state of the *protective system* (3.6)

[SOURCE: ISO 13574:2015, 2.164]

3.8
safety device
device that is used to perform protective functions, either on its own or as a part of a *protective system* (3.6)

EXAMPLE *Sensors* (3.9), limiters, flame monitors, burner control systems, logic systems, *final elements* (3.1), and automatic shut-off valves.

3.9
sensor
device that produces a signal based on a process variable

EXAMPLE Transmitters, transducers, process switches, and position switches.

© ISO 2022 – All rights reserved

3.10
system for permanent operation
system, which is intended to remain in the running position for longer than 24 h without interruption

[SOURCE: IEC 60730-2-5:2013+AMD1:2017+AMD2:2020 CSV, 2.5.101]

3.11
system for non-permanent operation
system, which is intended to remain in the running position for less than 24 h

[SOURCE: IEC 60730-2-5:2013+AMD1:2017+AMD2:2020 CSV, 2.5.102]

4 Design requirements for equipment in a protective system

4.1 General

Electrical installations and equipment shall comply with IEC 60204-1:2016 and withstand the intended operating stresses and external influences and hazards identified in the risk assessment required at the design stage. Electrical installation and equipment shall be protected against damage. In particular, it shall be robust to withstand damage during continuous operation.

Devices shall be used in accordance with their instructions including safety manuals. Any device used outside of its published instructions shall be verified and validated to be suitable for the intended application.

Devices of a protective system shall withstand the environmental conditions according to IEC 60204-1:2016, 4.4 and fulfil their intended function.

Sensors (e.g. pressure transmitters, temperature transmitters, flow transmitters) used in the protective system shall be independent from the process control system.

NOTE 1 Operating information can be exchanged but cannot compromise the functional safety of the protective system.

Safe state shall be realized by de-energized circuits only.

Functional safety requirement, as identified in the ISO 13577 series shall be in accordance with the IEC 61508:2010 series, the IEC 61511:2016 series, IEC 62061:2021 or ISO 13849-1:—[2)]as applicable, and implemented with the required SIL/PL for each function.

For the determination of the performance level of a safety function according to ISO 13849-1:—, the alternative procedure as stated in ISO 13849-1:—, 6.1.9 is not allowed.

Figure 1 is provided as an aid to understand the relationship between the various elements of TPE and their ancillary equipment, the heating system, the process control system and the protective system.

2) Fourth edition under preparation. Stage at the time of publication: ISO/DIS 13849-1:2022.
