Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents. ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 82, *Mining*, in cooperation with Technical Committee ISO/TC 127, *Earth-moving machinery*, in collaboration with the European Committee for Standardization (CEN) Technical Committee CEN/TC 196, *Mining machinery and equipment – Safety*, in accordance with the Agreement on technical cooperation between ISO and CEN (Vienna Agreement).

This first edition of ISO 18758 cancels and replaces the first edition of ISO 18758-2:2018 which has been technically revised.

The main changes are as follows:

a) the short-form term rig has generally been replaced by machine;

b) the scope, vocabulary, structure and internal references have been revised, and repeated requirements have been deleted;

c) requirements for manual handling, lifting, access systems, transport locking and carrier machines have been revised;

d) electrical, high-voltage, electromagnetic-compatibility and lightning-protection requirements have been added or revised;

e) requirements for operator stations have been revised, including operator enclosures, seats, seat belts, field of view, protective structures, glazing, vibration and operator-enclosure air quality;

f) requirements for boom-mounted working platforms and temporary roof-support systems have been revised;

g) performance-level and validation requirements have been added for identified safety-related control functions;

h) requirements for emergency stops, cableless controls, diagnostics, laser equipment and control-system security have been added or revised;

i) requirements for fluid-power systems, structural strength and rigid-body stability have been revised;

© ISO 2026 – All rights reserved

j) carrier-brake requirements and test methods have been revised to align more closely with ISO 3450;

k) winch, rope and chain requirements have been revised;

l) requirements for protection against moving and rotating drilling parts have been revised, including requirements for guards, person-detection systems, restricted drill-string handling mode, drill-movement disabling switches and two-hand controls;

m) noise and vibration requirements and their associated test codes have been revised;

n) requirements for propulsion batteries, lithium-ion battery systems and conductive charging have been added;

o) diesel-engine, fuel-system and fire-protection requirements have been revised, including fixed fire-suppression systems for self-propelled underground machines;

p) requirements for explosive atmospheres and drill-dust suppression have been added and strengthened;

q) verification table has been added to Clause 5;

r) Clause 6 has been expanded to include revised requirements for signals, warning devices, safety signs, graphical symbols, marking and instructions for use;

s) the annexes and Bibliography have been restructured and revised.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

This document is a type C standard as stated in ISO 12100:2010.

This document is of relevance, in particular, for the following stakeholder groups representing the market players with regard to machinery safety:

— machine manufacturers;

— mining companies;

— health and safety bodies (regulators, accident prevention organisations, market surveillance, etc.).

Others that can be affected by the level of machinery safety achieved with the means of the document by the above-mentioned stakeholder groups are:

— machine operators;

— service providers, e.g. for maintenance;

— third party system and technology providers.

The above-mentioned stakeholder groups have been given the possibility to participate in the drafting process of this document.

The machinery concerned and the extent to which hazards, hazardous situations or hazardous events are covered are indicated in the scope of this document.

The vocabulary of ISO 22932-5 is essential for the understanding of the safety requirements of this document.

When requirements of this type C standard are different from those which are stated in type A or B standards, the requirements of this type C standard take precedence over the requirements of the other standards, for rock drill rigs and rock reinforcement rigs that have been designed and built in accordance with the requirements of this type C standard.

The following assumptions were made in writing this document:

a) the operators of the machines are well trained professionals and aware of potential risks of using the machine in the working environment, including the hazards of reasonably foreseeable misuse (see ISO/IEC Guide 51:2014, 6.1 a), b));

b) the machines are operated and maintained in accordance with the instructions given by the manufacturer, such as instruction handbook (see ISO/IEC Guide 51:2014, 7.4.2.2);

c) that administrative controls are in place for preventing unauthorized entry of persons to the area where machines are working (see ISO/IEC Guide 51:2014, 6.2.2 and note).

For increased readability of this document, rock drill rigs and rock reinforcement rigs are called machines from Clause 4 onwards unless the specific term is needed for emphasis or clarity.

Where for clarity an example of a safety measure is given in the text, this does not need to be considered as the only possible solution. Alternative could exist that achieve an equivalent level of risk reduction.

Mining and earth-moving machinery — Rock drill rigs and rock reinforcement rigs — Safety requirements

1 Scope

This document specifies the safety requirements for rock drill rigs and rock reinforcement rigs designed for the following underground or surface operations:

a) blast hole drilling;

b) rock reinforcement and consolidation (injection holes, pipe roofing, netting, bolting);

c) drilling for secondary breaking;

d) dimensional stone drilling;

e) mineral prospecting, e.g. utilizing core drilling or reverse circulation drilling;

f) water and methane drainage drilling;

g) raise boring;

when used by a well-trained operator in accordance with the information for use and where sufficient measures have been taken to prevent unauthorized entry of persons to the area where machines are working.

NOTE Machines can be designed for more than one of the operations above. See ISO 22932-4 and ISO 22932-5 for vocabulary.

This document is not applicable to the following machines: drill rigs for soil and rock mixture, Kelly drill rigs and casing drivers, cable tool drill rigs, pre-armouring machines, sonic drill rigs, shaft sinking drill rigs, crane attached drill rigs, drill rigs on derricks, scaling machines.

This document deals with the relevant and significant hazards, hazardous situations, or hazardous events, as listed in Annex C, when the machine is used as intended and under the conditions of misuse which are reasonably foreseeable by the manufacturer.

This document is not applicable to machines manufactured before the date of its publication.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. 3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO 2041, ISO 3450, ISO 3740, ISO 3864, ISO 4871, ISO 7010, ISO 9244, ISO 11200, ISO 11201, ISO 12100, ISO 14120, ISO 22932-5 and IEC 60204-1 apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

— ISO Online browsing platform: available at https://www.iso.org/obp

— IEC Electropedia: available at https://www.electropedia.org/

— IEC Glossary: available at std.iec.ch/glossary

4 Safety requirements

4.1 General requirements

4.1.1 General

Machinery shall conform to the safety requirements of this document. In addition, the machine shall be designed in accordance with the principles of ISO 12100 for hazards which are not dealt with by this document.

4.1.2 Handling of the machine and its parts

4.1.2.1 Manual handling

Components that require manual handling during operation shall be in accordance with Table 1.
