# Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents) or the IEC list of patent declarations received (see http://patents.iec.ch).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*.

A list of all parts in the ISO/IEC 30145 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

# Introduction

## 0.1 General

The purpose of this document is to assist city chief information officers (CIO) and other stakeholders in planning and implementing a smart city. It comprises the following three parts:

— Part 1: Smart city business process framework

— Part 2: Smart city knowledge management framework

— Part 3 (this document): Smart city engineering framework

Each of the three parts is aimed at a different role or viewpoint within the city and thus separate focus needs to be maintained. The "separation of concerns" is a principle for the development of a city as it uses ICT to deliver the vision and objectives for the city. The value of using the separation of concerns is to simplify development and maintenance of the architecture as the city both develops and delivers improved outcomes for the city stakeholders.

Figure 1 shows the components of the smart city ICT reference framework, which consist of 5 components: stakeholders, vision and outcomes, the business process framework, the knowledge management framework, and the engineering framework. While stakeholders, vision and outcomes, and the engineering framework are described in this document, the business process framework and knowledge management framework are described in ISO/IEC 30145-1:—[1)] and ISO/IEC 30145-2:—[2)], respectively.

1) Under preparation. Stage at the time of publication: ISO/IEC DIS 30145-1:2020.

2) Under preparation. Stage at the time of publication: ISO/IEC DIS 30145-2:2020.

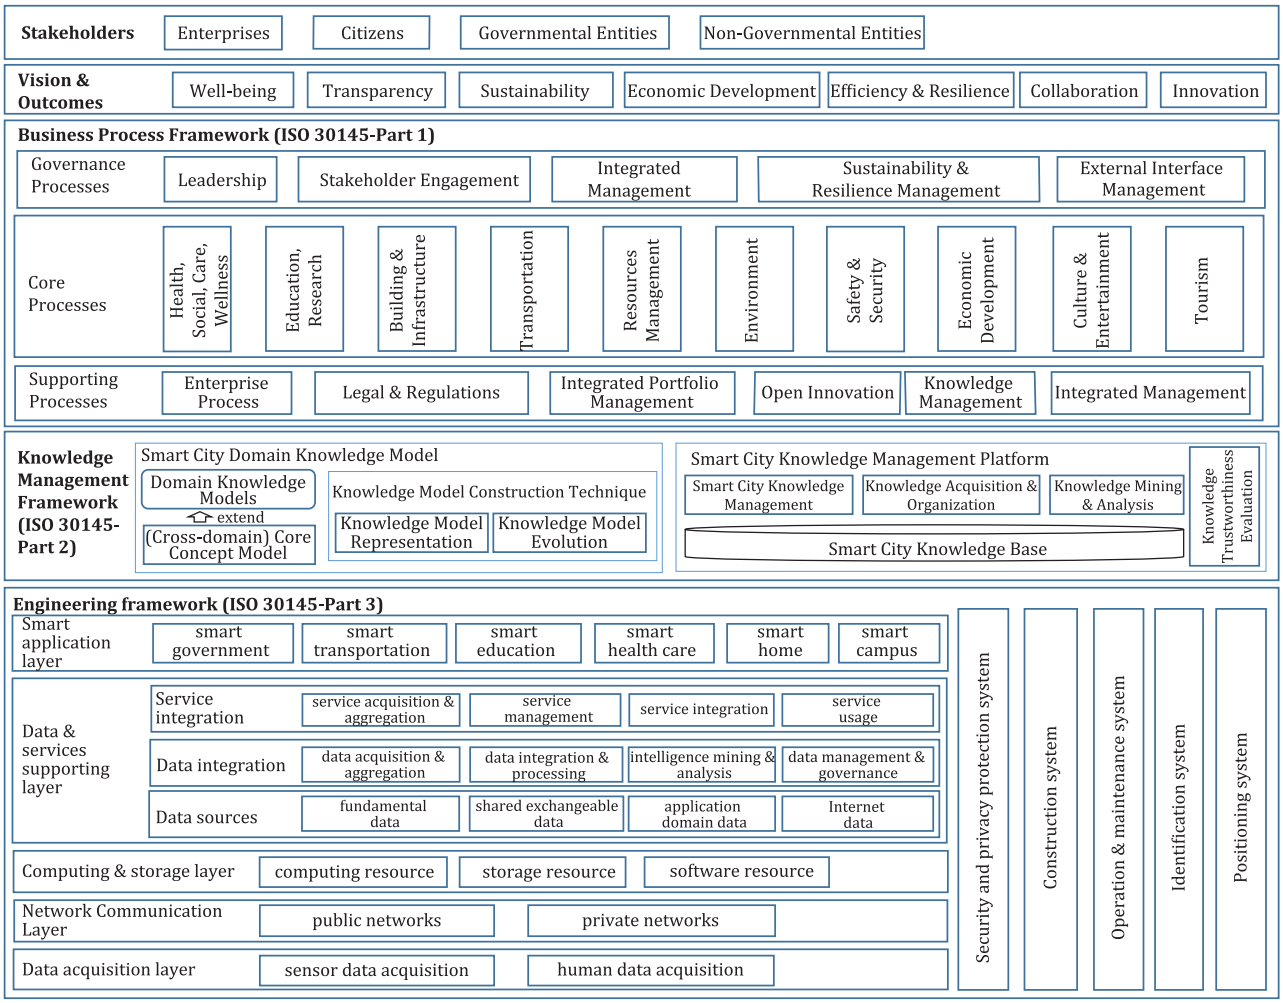

**Figure 1 — Smart city ICT reference framework**

## 0.2 Stakeholders

The stakeholders served by the smart city ICT reference framework are businesses, citizens, government organizations and non-government organizations. This stakeholder list is not exhaustive but defines the key stakeholders in a smart city and the user for the smart city ICT reference framework.

## 0.3 Vision and outcomes

The motivation of making a city smart is a result of a shared vision and a set of agreed outcomes from all of the city stakeholders. The vision and outcomes of the smart city ICT reference framework are well-being, transparency, sustainability, economic development, efficiency and resilience, collaboration and innovation. This vision and outcomes list is not exhaustive but defines the key vision and outcomes of a smart city. The smart city ICT reference framework articulates a vision that the smart city will be transparent in the delivery of city services which meet city sustainability ambitions. This vision uses collaboration and innovation approaches to deliver desired city outcomes. City outcomes are expected to improve efficiency and resilience of city services and promote economic development activities which enhance the well-being of citizens.

# Information technology — Smart City ICT reference framework —

# Part 3:
# Smart city engineering framework

## 1 Scope

This document describes a framework, structured in layers of ICT technologies, essential for smart cities' operation. This framework also provides the mapping of the ICT techniques to various system entities in order to support the smart city's business, knowledge management, and operational systems from the engineering perspective.

## 2 Normative references

There are no normative references in this document.

## 3 Terms and definitions

For the purposes of this document, the following terms and definitions apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

— ISO Online browsing platform: available at https://www.iso.org/obp

— IEC Electropedia: available at http://www.electropedia.org/

### 3.1 General terms

**3.1.1**
**data**
symbols and signals that represent properties of objects, persons, events and their environment

Note 1 to entry: In the English language the term "data" is generally used as a plural noun. For use in the singular, the term "data item" is sometimes used.

**3.1.2**
**information**
structured *data* (3.1.1) that are endowed with meaning and purpose

Note 1 to entry: Information is data that have been shaped into a form that is meaningful and useful to human beings.

**3.1.3**
**positioning system**
system of instrumental and computational components for determining position

EXAMPLE Inertial, integrated, linear, optical and satellite positioning systems.

[SOURCE: ISO 19116:2019, 3.24]

© ISO/IEC 2020 – All rights reserved

**3.1.4**
**positional accuracy**
closeness of coordinate value to the true or accepted value in a specified reference system

Note 1 to entry: The phrase "absolute accuracy" is sometimes used for this concept to distinguish it from relative positional accuracy. Where the true coordinate value may not be perfectly known, accuracy is normally tested by comparison to available values that can best be accepted as true.

[SOURCE: ISO 19116:2019, 3.22]

**3.1.5**
**heterogeneous computing**
system that uses more than one kind of processor or cores

**3.1.6**
**heterogeneous computing resources**
combination of hardware and software that can support *heterogeneous computing* (3.1.5)

**3.1.7**
**data integration**
process of combining *data* (3.1.1) residing in different sources and providing users with a unified view of them

## 3.2 Abbreviated terms

| WGS84 | world geodetic system |
| GPS | global positioning system |
| GLONASS | global navigation satellite system |
| PZ-90 | parametry zemli 1990 goda |

# 4 Smart city engineering framework

## 4.1 Introduction

This document gives descriptions of a Smart city from an engineering perspective. It consists of two parts, the horizontal engineering layers and the vertical systems. For each of the business processes defined and categorized in ISO/IEC 30145-1, a city uses the knowledge defined by the knowledge management framework in ISO/IEC 30145-2. Additionally, the knowledge defined by the knowledge management framework in ISO/IEC 30145-2 is used to understand how the engineering framework is implemented. The function of the horizontal layers is to provide a clear mapping of different techniques and components needed for smart city business processes. The function of the vertical systems is to guarantee the consistency of the technical implementation of a smart city.

## 4.2 Overview of the smart city engineering framework

Figure 2 shows the smart city engineering framework from the ICT perspective. The framework consists of 5 horizontal layers and 5 vertical cross layer systems with 4 types of smart city stake holders. The five layers are data acquisition layer, network communication layer, computing and storage layer, data and services supporting layer and smart application layer; whereas the five systems are security and privacy protection system, construction system, operation and maintenance system, identification system and positioning system. In addition, the four types of city users are citizens, enterprises, governmental entities and non-governmental entities. The five layers and five systems are introduced in detail in 4.3 to 4.12 respectively.
