Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives or www.iec.ch/members_experts/refdocs).

ISO and IEC draw attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO and IEC take no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO and IEC had received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents and https://patents.iec.ch. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html. In the IEC, see www.iec.ch/understanding-standards.

This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 6 *Telecommunications and information exchange between systems*.

A list of all parts in the ISO/IEC 4396 series can be found on the ISO and IEC websites.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html and www.iec.ch/national-committees.

Introduction

The common distributed application protocol (CDAP) is used by communicating recursive inter-network architecture (RINA) applications to exchange application-specific data and effect remote actions. CDAP implements the protocol messages and state machines to allow the two endpoints of a communication flow to exchange read/write, start/stop, and create/delete method invocations on remote "objects". The semantics of those objects and operations are opaque to the CDAP protocol itself. Because CDAP is not specific to RINA, it can be used by any distributed application that needs to share information or initiate state changes with another application over a network. CDAP is used in the RINA architecture by applications, and specifically by inter-process communication (IPC) Processes, which are specialized applications that cooperate to create a Distributed IPC Facility (DIF) that provides network transport to other applications.

Telecommunications and information exchange between systems — Recursive inter-network architecture —

Part 3: Common distributed application protocol

1 Scope

This document provides the common distributed application protocol (CDAP) specification. CDAP enables distributed applications to deal with communications at an object level, rather than forcing applications to explicitly deal with serialization and input/output operations. CDAP provides the application protocol component of a distributed application facility (DAF). CDAP provides a straightforward and unifying approach to sharing data over a network without having to create specialized protocols.

This document provides:

— an overview of CDAP;

— the specification of CDAP;

— a description of policies, in the specific sense introduced in the text;

— notes on the context of CDAP.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO/IEC 4396-1, *Telecommunications and information exchange between systems – Recursive Inter-Network Architecture — Part 1: RINA Reference Model*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO/IEC 4396-1, and the following apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

— ISO Online browsing platform: available at https://www.iso.org/obp

— IEC Electropedia: available at https://www.electropedia.org/

3.1
application object model
common distributed application protocol (CDAP) object model used in the application connection (AC) data transfer phase.

Note 1 to entry: If an AE is capable of supporting multiple object models, this selects the one to be used for this AC. If not, the requested object model value should match that of the sole implemented model.
