Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives or www.iec.ch/members_experts/refdocs).

ISO and IEC draw attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO and IEC take no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO and IEC had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at www.iso.org/patents and https://patents.iec.ch. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see www.iso.org/iso/foreword.html. In the IEC, see www.iec.ch/understanding-standards.

This document was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, Subcommittee SC 37, *Biometrics*.

This third edition cancels and replaces the second edition (ISO/IEC TR 24722:2015), which has been technically revised.

The main changes are as follows:

— the content of Clause 3 has been removed and ISO/IEC 2382-37 has been listed as a normative reference;

— to enhance information accessibility, symbol descriptors have been paired with clear descriptions;

— the structure of the document has been updated, and various editorial modifications have been made, in order to improve technical accuracy and bring the document in line with the most recent edition of the ISO/IEC Directives Part 2.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html and www.iec.ch/national-committees.

Introduction

Some applications of biometrics require a level of biometric performance that is difficult to obtain with a single biometric measure. Such applications include the prevention of multiple applications for national identity cards and security checks for air travel. In addition, provisions are needed for data subjects who are unable to give a reliable biometric sample for some biometric characteristic types.

Use of multiple biometric measurements from substantially independent biometric sensors, algorithms or characteristic types typically gives improved technical performance and reduces risk. This includes an improved level of performance where not all biometric measurements are available, such that decisions can be made from any number of biometric measurements within an overall policy on accept/reject thresholds.

Of the various forms of multibiometric systems, the potential for multimodal biometric systems, each using an independent measure, has been discussed in technical literature since at least 1974.[22],[45] Advanced methods for combining measures at the score level have been discussed in References [15] and [16]. At the current level of understanding, combining results at the score level typically requires knowledge of both mated and non-mated score distributions. All of these measures are highly application-dependent and generally unknown in any real system. Research on the methods not requiring previous knowledge of the score distributions is continuing and research on fusion at both the image and feature levels is still progressing.

Given the current state of research into these questions and the highly application-dependent and generally unavailable data required for proper fusion at the score level, work on multibiometric fusion can in the meantime be considered mature. By intention, this document is not issued as International Standard, in order not to force industrial solutions to conform to the methodology described herein. Rather, the present edition of this document provides a mature technical description for developments of multibiometric systems. It also provides a reference on multibiometric fusion for developers of other biometric standards and implementers.

Information technology — Biometrics — Multimodal and other multibiometric fusion

1 Scope

This document provides descriptions and analyses of current practices on multimodal and other multibiometric fusion, including (as appropriate) references to more detailed descriptions.

This document contains descriptions and explanations of high-level multibiometric concepts to aid in the explanation of multibiometric fusion approaches including: multi-characteristic-type, multi-instance, multi-sensorial, multialgorithmic, decision-level and score-level logic.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO/IEC 2382-37, *Information technology — Vocabulary — Part 37: Biometrics*

3 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO/IEC 2382-37 and the following apply.

ISO and IEC maintain terminology databases for use in standardization at the following addresses:

— ISO Online browsing platform: available at https://www.iso.org/obp

— IEC Electropedia: available at https://www.electropedia.org/

3.1
multialgorithmic
using multiple algorithms for processing the same biometric sample

3.2
multibiometrics
automated recognition of individuals based on their biological or behavioural characteristic and involving the use of biometric fusion

3.3
multi-characteristic-type
multi-type
using information from multiple types of biometric characteristic

EXAMPLE Biometric characteristic types include: face, voice, finger, iris, retina, hand geometry, signature/sign, keystroke, lip movement, gait, scent, vein, DNA, ear, foot, etc.

3.4
multi-instance
requiring two or more instances of a biometric characteristic

EXAMPLE Iris (left) + Iris (right), Fingerprint (left index) + Fingerprint (right index).

Note 1 to entry: [SOURCE: ISO/IEC 2382-37:2022, 37.03.47, modified — Note 1 to entry has been removed and an Example has been added.]

3.5
multipresentation
using either multiple presentation samples of one instance of a biometric characteristic or a single presentation that results in the capture of multiple samples.

EXAMPLE Several frames from video camera capture of a face image (possibly but not necessarily consecutive).

Note 1 to entry: Multipresentation biometrics is considered a form of multibiometrics if fusion techniques are employed. Many fusion and normalization techniques are appropriate to the integration of information from multiple presentations of the same biometric instance.

3.6
sequential presentation
capturing biometric samples in separate capture events to be used for biometric fusion

3.7
simultaneous presentation
capturing biometrics samples in a single capture event to be used for biometric fusion

4 Overview of multimodal and other multibiometric systems

4.1 General

In general, the use of the terms multimodal or multibiometric indicates the presence and use of more than one characteristic type, sensor, instance and/or algorithm in some form of combined use for making a specific biometric identification or verification decision. The methods of combining multiple samples, comparison scores or comparison decisions can be very simple or mathematically complex. For the purpose of this document, any method of combination will be considered a form of "fusion". Combination techniques will be covered in Clause 5 of this document.

Multimodal biometrics were first proposed, implemented and tested in the 1970s.[22,45] Combining measures was seen as a necessary future requirement for biometric systems. It was widely thought that combining multiple measures could increase either security by decreasing the false acceptance rate or data subject convenience by decreasing the false rejection rate. These systems did not seem to advance into practical applications.

The use of fusion and related methods has been a key tool in the successful implementation of largescale automated fingerprint identification systems (AFISs), starting in the 1980s, and was further expanded upon with the introduction of automated biometric identification systems (ABISs) in the 1990s. Most methods of fusion discussed elsewhere in this document have been successfully implemented using fingerprints alone. Some of the ways that fusion has been implemented in AFISs include:

— image fusion (also known as sample fusion), where a single "rolled" image is created from a series of plain impressions on a livescan device;

— template fusion, where features extracted from several presentations are combined into a single template;

— multi-instance fusion, which uses fingerprints from all ten fingers;

— multipresentation fusion, which uses rolled and slap (plain) fingerprints;

— algorithm fusion for the purpose of efficiency (cost, computational complexity, and throughput rate), where comparators are generally used as a series of filters in order of increasing computational complexity. These are generally implemented as a mix of decision and score-level fusion;
